

Using Weed Barrier Fabric in Windbreak & Shelterbelt Applications

- ✓ Economical weed control practice.

◆ Precision in row Tillage is economical. A full service contract cost is \$190.00 per season and rows only is \$160.00 per season.

- ◆ The Weed Badger provides:
 - ✓ Precise depth control.
 - ✓ Mulches the upper soil level.
 - ✓ Provides good airflow, Light, Water Penetration in close to the trees.
 - ✓ Soil aeration & sanitation of the strip.
 - ✓ Clean appearance.
 - ✓ Reduce run-off from winter packed soil surface.

Weed Badger At Work

It is recommended to Weed Badger 4 times per season. The first application removes the top portion of the weeds and grass, leaving the deep root intact. The second application is done after a period of time, which allows the weeds to dry up. The weeds should not be over 6" tall. The long root is using a lot of energy to produce a new green leaf. This in turn makes the weed weaker. The third pass through is timed the same as the second and the weeds should not be over 6" tall. The weed and grass population by this point has been greatly reduced.

Most of the weeds have been starved out.

We have found that a 4th cultivation done late gives at least 2 weeks longer next spring that is weed free. This cultivation program is used for 3 years with the fall of the 3rd year grass being planted. The grass will have a better establishment rate and will be more weed free.

Trees cultivated on this

*program have shown twice
the growth in
4 years time Cultivated*

Non-Cultivated

*A cultivator is pulled behind the tractor to till up the soil in between the rows.
The Weed Badger is an attachment on the tractor that is operated through*

*planted under the same
conditions and location.*

*hydraulics to raise/lower and
moves the badger arm in and
out around the trees.
Carefully weeding between
every tree in the row.*
